

Azure DevOps Release Pipelines

for SQL Databases, Azure Data Factories, and Analysis Models

What is your pain?

Development Chaos

Tracking changes

Multiple developers

Ad hoc, manual deployments

Can you answer these questions?

Who/what/where/when/why

“Where is the code for the Production environment?”

“Where is the latest code deployed?”

“Why does this view/sproc reference a column (or table) that doesn’t exist? (and how long has it been this way?)”

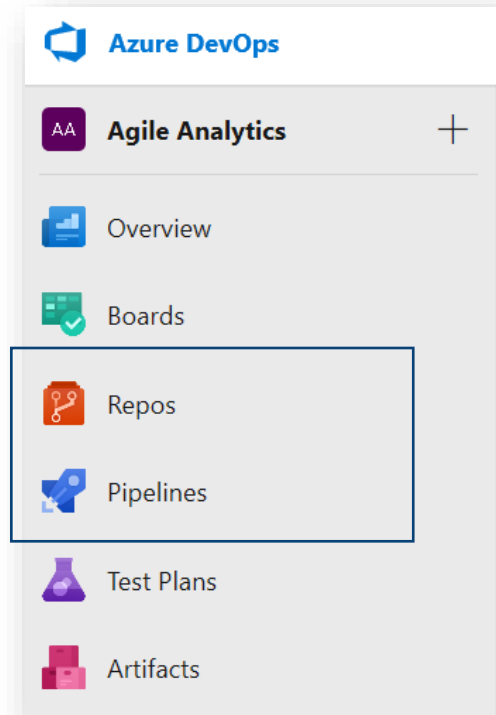

Azure DevOps

Why we need Azure Pipelines

Azure Pipelines

Compile source code to discover issues early

Deploy assets consistently from source control repository

Maintain clearly defined environments

Auditing

Allow for change, reduce brittleness, *increase velocity*

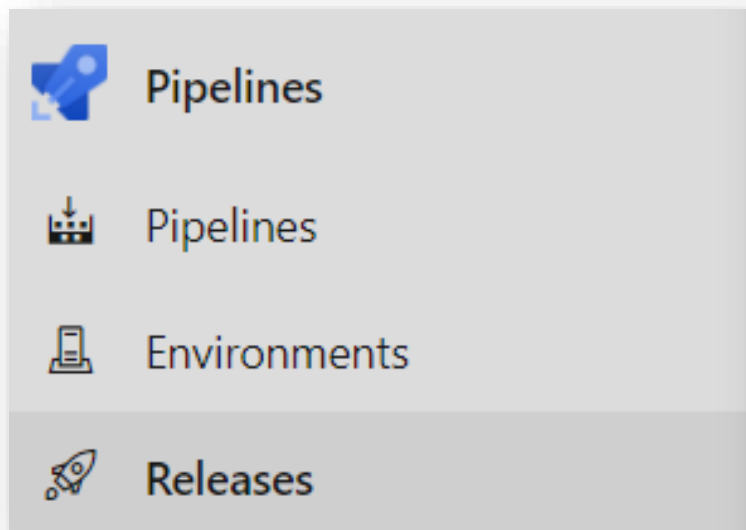

Pipeline Types

- **Pipelines**

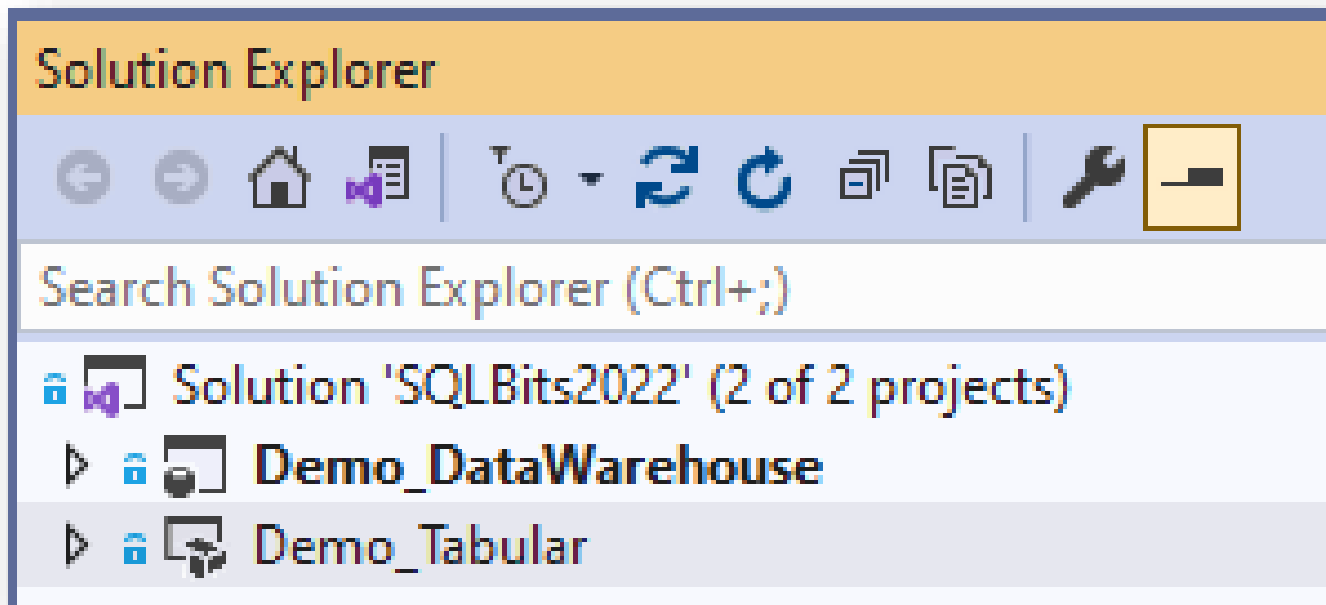

- Compile source code to create artifacts

- **Releases**

- Use build artifacts to deploy to environments

.asproj

Azure Data Factory

Compiler type

MSBuild

MSBuild

npm script

Output file

.DACPAC

.ASDatabase

ARMTemplate.json

Build Pipeline

VS Solution Build Tasks:

Visual Studio Build (SqlBits2022.sln)

- Demo_Datawarehouse.sqlproj →
Demo_Datawarehouse.dacpac,
Demo_Datawarehouse_Release.publish.xml, etc
- Demo_Tabular.asproj →
Model.asdatabase

Copy Artifacts to Staging

- Copies compiled output to artifact staging folder on agent

Publish Artifacts

- Packages artifact staging files and uploads to Azure DevOps build pipeline

Azure Data Factory

Automated ARM Template Generation

Build Pipeline

Data Factory

Build Tasks:

```
npm install
```

- Loads @microsoft/azure-data-factory-utilities package
- (References package.json file in repo)

```
npm custom
run build validate <<sourcefolder>> <<AzureResourceString>>
```

- Validates json files (like "Validate All" button in ADF)

```
npm custom
run build export <<sourcefolder>> <<AzureResourceString>> "ARMTemplate"
```

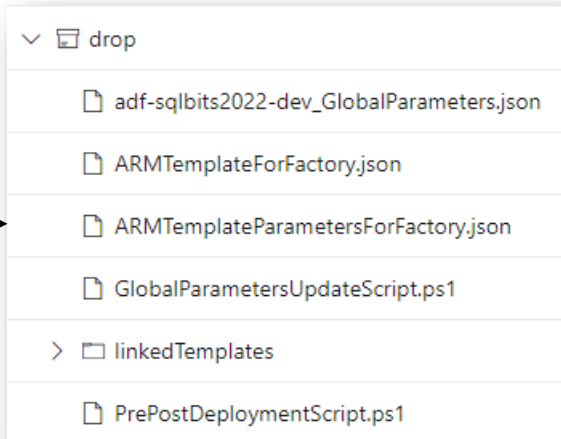

- Validates files and generates template files and PowerShell scripts

Copy Artifacts to Staging

- Copies files generated in ARMTemplate folder to artifact staging folder on agent

Publish Artifacts

- Packages artifact staging files and uploads to Azure DevOps build pipeline

datafactory	adf-sqlbits2022-\$(Release.EnvironmentName)	Release
demoConnectionString	Initial Catalog=\$(DemoDB);Data Source=\$(SqlServer);Integrated Securi...	Release
DemoDB	demo_\$(Release.EnvironmentName)	Release

• Releases

- Used for configuration of environment-specific resources, like database names, locations, passwords
- Variables not often used in **build** pipelines

Release Pipeline

Database Deployment Task

Azure Pipelines

Pipelines

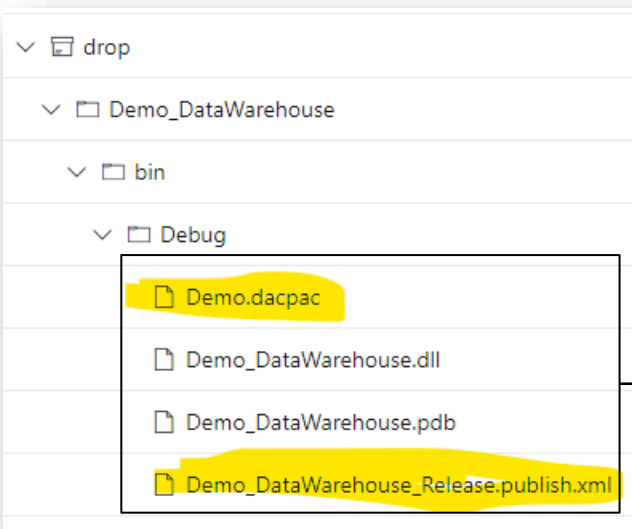

Pipelines

Environments

Releases

Task 1 – Create Change Script

- Connect to \$(SqlServer), using Service Principal identity
- Create Script of changes to \$(DatabaseName) from artifact Demo.dacpac, using profile Demo_Datawarehouse_release.publish.xml
- Uses SQLPACKAGE.EXE

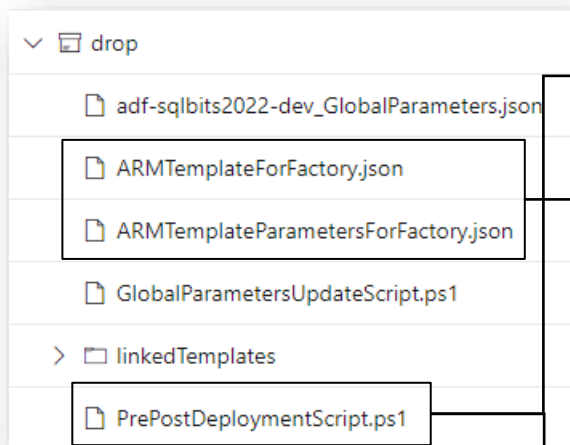

Task 2 – Publish changes to database

- Connect to \$(SqlServer), using Service Principal identity
- Deploy \$(DatabaseName) from artifact Demo.dacpac, using profile Demo_Datawarehouse_release.publish.xml
- Uses SQLPACKAGE.EXE

Release Pipeline

Deploy Azure Data Factory Tasks

Task 1 – Disable Triggers (PowerShell)

- Execute PrePostDeploymentScript.ps1
- -predeployment \$true

Task 2 – Deploy ARM template

- -factoryName \$(datafactory) – Demo_connectionString “\$(DemoConnectionString) –AdventureWorks_connectionString “\$(AdventureWorksConnectionString)”

Task 3 – Cleanup (PowerShell)

- Execute PrePostDeploymentScript.ps1
- -predeployment \$false
- Removes objects in ADF not in template

Release Pipeline

Warning: ARM Template Deployment mode

Azure Pipelines

Pipelines

Pipelines

Environments

Releases

\$(System.DefaultWorkingDirectory)/_SqlBits2022-ADF-CI/drop/ARMTemplateForFactory.json

Template parameters ⓘ

\$(System.DefaultWorkingDirectory)

Override template parameters

-factoryName \$(datafactory).
"\$(DemoConnectionString)"

Deployment mode * ⓘ

Incremental

Advanced ^

Deployment name ⓘ

Deployment outputs ⓘ

Refer to [this](#) for more details.

Incremental mode handles deployments as incremental updates to the resource group. It leaves unchanged resources that exist in the resource group but are not specified in the template.

Complete mode deletes resources that are not in your template. Complete mode takes relatively more time than incremental mode. If the task times out, consider increasing the timeout, or changing the mode to 'Incremental'.

[Warning] Complete mode will delete all the existing resources in the resource group that are not specified in the template. Do review if the resource group you're deploying to doesn't contain any necessary resources that are not specified in the template.

Validate mode enables you to find problems with the template before creating actual resources. Validate mode enables you to find problems with the template before creating actual resources. Please note that this mode will anyways create a resource group even if it does not deploy any resource.

By default, Incremental mode is used.

Release Pipeline

Deploy Azure Data Factory Tasks – global parameters

Azure Pipelines

Pipelines

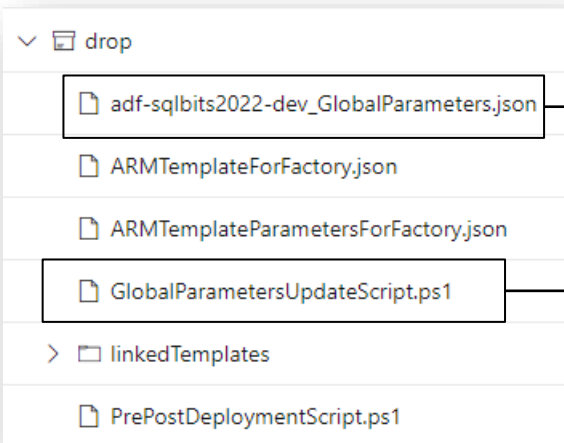

Pipelines

Environments

Releases

Task 4 – Transform parameters json

- File transform file task
- adf-sqlbits2022-dev_GlobalParameters.json
- Variables: Name.Value matching parameter names

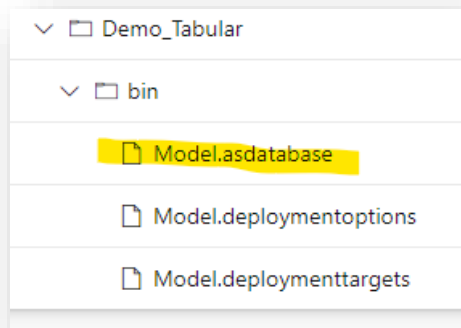

Task 5 – Set global parameters (PowerShell)

- Execute GlobalParametersUpdateScript.ps1
- Script arguments:
-globalParametersFilePath <<path>>adf-sqlbits2022-dev_GlobalParameters.json

Release Pipeline

Deploy Tabular Model task

- Task – Execute PowerShell Script
- Connects to XMLA endpoint (Azure Analysis Server or Power BI Premium workspace)
 - Deploys Model.asdatabase
 - Updates SQL datasource connection
 - Refreshes model (optional)

XMLA
endpoints:

`powerbi://api.powerbi.com/v1.0/myorg/SQLBits 2022 Beta`
`asazure://canadacentral.asazure.windows.net/sqlbits2022md`

Demo: Release Pipelines

Azure DevOps

Pipelines

Pipelines

Environments

Releases

Recommendations

- Start with “Classic Editor” instead of YAML
- Use PowerShell and Command tasks
- Define stages to match your environments (Integration, Test, UAT, Prod)
- Use \$(variables) to simplify pipeline development
- Invest time early to develop build and release pipelines
